LIST OF PLATES

Gently undulating land in the northern part of the Avoca River catchment supports cropping and grazing. The rugged form of Mount Buckrabanyule appears in the distance	8
A woodland of Eucalyptus microcarpa and E. leucoxyton near Archdale	36
Eucalyptus camaldulensis woodland on the banks of the Avoca River	36
Low woodland of E macrorhyncha, E polyanthemus, E. gonicalyx and heath spp. near Archdale	36

Open scrub country near St Arnaud, dominated by <i>E. polybractea</i>	37
A woodland of <i>Casuarina luehmannii</i> near Charlton (above) contrasts with one of <i>Eucalyptus microcarpa</i> , <i>E. leucoxyton</i> and <i>C. luehmannii</i> near Archdale (below).....	38
Light grazing country near Avoca.....	39
Cropping is the predominant land use in the Charlton area, and stubble-burning (right) is still a common practice when several crops are grown in succession.....	40
Vineyards on the gentle slopes near Moonambel are a relatively new form of land use.....	40
Establishment of <i>Pinus radiata</i> has commenced on the Great Dividing Range south of Amphitheatre.....	41
Harvesting the mallee scrub near Wedderburn for the eucalyptus oil.....	41
Road-making material is quarried from metamorphosed Ordovician sediments near Charlton.....	42
Gravel-stripping occurs on isolated Tertiary gravel deposits in the west.....	42
Old gold-mines and their associated mullock heaps are common on the alluvial plains near Avoca.....	43
Aerial photo showing land system boundaries, south of Amphitheatre.....	46
Removal of trees from steep slopes has caused deterioration throughout the catchment. Its forms include sheet and gully erosion, land slips, excessive run-off, flash flooding, saline seepage areas, siltation and turbidity in water storages.....	131
Severe gully erosion removes land from production, reduces accessibility and causes off-site problems such as siltation and turbidity of streams and water supplies.....	132
Saline seepage can cause complete destruction of all vegetation in the affected area.....	133
The valuable topsoil on a cultivated alluvial terrace is shown being removed by wind action.....	134
A dense stubble layer protects a sandy, erodible topsoil from possible intense summer thunderstorms.....	136
Contour banks and grassed waterways allow the safe collection and disposal of overland water flow.....	137

LIST OF APPENDICES

APPENDIX I CHEMICAL DATA FOR SOIL PROFILES.....	142
APPENDIX II CHEMICAL DATA FOR SOIL PROFILES.....	145
APPENDIX III - METHODS OF SOIL ANALYSIS.....	146
APPENDIX IV - SOIL PROFILE DESCRIPTIONS.....	147
APPENDIX V - ATTERBERG LIMITS.....	152
APPENDIX VI - METHODS OF LAND SYSTEM DESCRIPTION.....	153
APPENDIX VII - FLORISTIC LIST.....	156
