FOREWORD

This study was undertaken for the Lexton Landcare Group as part of an inventory of the natural resources of the Landcare area at a scale suitable for interpretation at a regional level. The purpose of this inventory is to enable more efficient planning of revegetation and soil improvement programmes as part of the Lexton Landcare Rehabilitation Strategy Project. This project aims to improve both the natural and agricultural environment.

ACKNOWLEDGEMENTS

The authors would like to thank the Lexton Landcare Group for the opportunity to undertake this study. Thanks goes to all those landowners who responded with information to the survey letter and in particular to Lionel and Geraldine Smith for providing assistance and very valuable local knowledge.

Andrew Tucker and Larissa Westbrooke, Melbourne University Forestry assisted with field work and Wendy Cloke with preparation of the maps.
