Total Taxa		23	16	16	15	17	31
Total Percentage		100	100	100	100	100	100

* All specimens have been identified to Family level where practical.

Acarina, Cyclopoida and Ostracoda have been identified to a higher taxonomic level, usually Order.

L-Larva A-Adult P-Pupa

Interpretation

Lake Lalbert has a relatively large number of taxa present including Ephemeroptera and Trichoptera which are sensitive to organic pollution (Victorian Community Water Quality Monitoring Task Group 1996) and Ephemeroptera and Atyidae which are sensitive to large increases in salinity (Kefford 1997). The dominant taxa, Zygoptera and Hemiptera indicate medium water quality in terms of organic pollution (Victorian Community Water Quality Monitoring Task Group 1996).

(Davies 1997)

LAKE LALBERT HAS REMAINED DRY SINCE MARCH 1998
